

Business Questions Deep-Dive Analysis

Question 1:

What is the overall baseline satisfaction across the company, and which specific high-level Division or Department is anchoring our average rating down?

The company-wide baseline customer satisfaction stands at a healthy 4.20 out of 5 stars across all 23,486 reviews. However, filtering this baseline reveals specific drag factors:

- **Division Level:** The General Division represents the highest volume of consumer interactions, capturing 58.97% of total reviews, yet it pulls down performance with the lowest average rating of 4.18.
- **Department Level:** The Trend Department is the clear organizational anchor, dropping significantly below the baseline to an underperforming average rating of 3.82.
- **Operational Context:** For comparison, the Casual Bottoms class represents a high-performing benchmark at an average rating of 4.50, proving that underperformance is isolated to specific areas rather than being a systemic product issue.

Question 2:

What percentage of customers actively recommend our products, and at what specific numeric Rating threshold does a customer decisively switch from a detractor to an advocate?

Brand advocacy is fundamentally strong, with 82.24% of all customers actively recommending their purchases. Analyzing recommendation conversion rates across specific star tiers isolates a sharp behavioral tipping point:

- **The Advocacy Zone:** At 5 stars, advocacy is absolute at 99.81%. At 4 stars, it remains incredibly safe at 96.69%.
- **The Tipping Point:** The decisive behavioral drop happens between 4 and 3 stars. Recommendation rates plummet from 96.69% down to 41.41% for a 3-star review.
- **The Detractor Zone:** True detractors emerge at 2 stars (only 6.01% recommend) and 1 star (dropping to 1.90%).
- **The Takeaway:** A drop to 3 stars isn't a neutral stance; it represents a 55.28% collapse in customer referral intent, defining 4 stars as our critical brand threshold.

Question 3:

Which underlying Product Classes (e.g., Knits, Dresses, Blouses) are our highest operational risks, generating the highest volume of 1-star and 2-star reviews?

By analyzing the specific product classes driving low-rating reviews (1-2 stars), volume is heavily concentrated in five core categories. Out of the 2,407 total high-risk reviews in the dataset, the exposure is ranked as follows:

1. Dresses: 689 low reviews
2. Knits: 506 low reviews
3. Blouses: 348 low reviews
4. Sweaters: 155 low reviews
5. Pants: 124 low reviews

This concentration pinpoints exactly where manufacturing teams must step in. Quality issues are not widespread across the brand; they are centered squarely around fit and fabric integrity in Dresses and Knits.

Question 4:

Does customer satisfaction and recommendation intent vary significantly by consumer age, or are bad reviews distributed evenly across all age groups?

The data reveals that customer sentiment and brand advocacy are remarkably uniform across all age brackets. Bad reviews are distributed evenly across our consumer demographics rather than being driven by a specific generation:

- **Rating Distributions:** Across every single age group, the breakdown remains highly consistent: roughly 10.25% rate products at 2 stars or less, 12.22% leave neutral 3-star reviews, and a dominant 77.53% provide positive 4 or 5-star ratings.
- **Recommendation Intent:** Advocacy remains stable across the board, with 85% of Gen Z (18–25) recommending products, 80% of Young Professionals (26–35), 82% of Established Adults (36–50), 84% of the Mature Market (51–65), and 85% of Seniors (66+).
- **The Takeaway:** Satisfaction issues are product-dependent and universal, not driven by age-specific preferences.

Do highly upvoted reviews (high Positive Feedback Count) lean primarily toward helpful product praises (5-stars) or highly visible public complaints (1-stars)?

- 1-Star Reviews: 842 total reviews, averaging 3.46 upvotes each.
- 2-Star Reviews: 1,565 total reviews, averaging 3.33 upvotes each.
- 3-Star Reviews: 2,871 total reviews, averaging 3.15 upvotes each.
- 4-Star Reviews: 5,077 total reviews, averaging 2.41 upvotes each.
- 5-Star Reviews: 13,131 total reviews, averaging 2.30 upvotes each.

Question 6:

A text-driven analysis isolating the 1 and 2-star reviews reveals specific, repeating keywords that dominate consumer titles: "quality", "fit", "fabric", "big", "pictured", and "small".

This text data proves that the vast majority of our detractors are flagging physical manufacturing and presentation flaws—specifically sizing inconsistencies (big/small), deviations from online photos (pictured), and subpar material choices (fabric/quality).
